

# Zebra Succulent

*Haworthiopsis attenuata*

## Care instructions

# Info

Haworthiopsis attenuata, commonly known as the Zebra Plant or Zebra Haworthia, is a small, clumping succulent native to South Africa. It is easily recognized by its dark green leaves adorned with raised white tubercles arranged in horizontal bands, giving it a striking striped appearance. This plant grows slowly and prefers bright, indirect light, making it well-suited for indoor cultivation. It thrives in well-draining, sandy soil and should be allowed to dry between waterings. Unlike many succulents, it can tolerate lower light and cooler conditions, though it prefers warmth and low humidity. It's a resilient, beginner-friendly plant that often produces offsets.

## Environmental Considerations

### Soil

Well-draining, sandy soil; Keep cool and mildly wet to prevent dormancy

### Upkeep

Let dry partially between waterings; low humidity; light fertilizer
